

Fig. 7. Stage specific protein in *C. toreuma* and *P. striata*.

A 22.2-kDa band is stained prominently at stage II in *C. toreuma* and the corresponding band ranged from stage I to stage IV. Similar to the *C. toreuma*, a 21.5-kDa band was spotted at stage II as a prominent band stained in the *P. striata* species. The upper rows are detected by Coomassie Blue staining, the lower rows are the autoradiography corresponding to it.
